Not illustrated. 1905 Excerpt: .proportion to the diameter of the road wheel and brake drum. Thus--(58)  $p = \frac{h}{H}$  in which  $D$  = the diameter of the road wheel,  $d$  = the diameter of the brake drum,  $p$  = the pull on the brake rod; and the other factors as before. Assuming the road wheels of the car in the example to be 30 inches diameter, and the brake drums 10 inches diameter, and rubber tyres 30 on the wheels, we have, from 58,  $p = 630 \times \frac{J}{Q} = 1890$  lbs. for the pair of brake bands, or 945 lbs. mean pull on each. In the case of sudden applications of the brakes, such as cause the wheels to skid, this pull of 945 lbs. will be much exceeded. For shoe brakes, acting directly on the tyres, the pressure can be found by dividing the mean resistance  $P$   $p$  by the coefficient of friction, or- $p$  which in our example 315 gives  $Q_j = 450$  lbs. on each tyre. In all the above calculations we have assumed the car to be travelling on a level road. Gradients will tend to lengthen or shorten the distance in which the car can be stopped, according to whether it is an up or down grade. Down grades will reduce the resistance  $P$ , and may be expressed as a fraction =  $\frac{1}{n}$ . The distance  $L$  in which the car can be stopped going downhill may then be calculated from--/en, T W Sa X 0-0334 (59J Li...
